

TASK 4 – CASE CLASSIFICATION & SEVERITY ANALYSIS

Pharmacovigilance Case Classification Report

Task ID: task4

1. OBJECTIVE

Classify each adverse drug reaction (ADR) according to **seriousness** and **expectedness**, and assess the clinical impact using pharmacovigilance principles.

2. CASE-WISE CLASSIFICATION

Case	Drug	Adverse Reaction	Seriousness	Expectedness	Clinical Assessment
01	Amoxicillin	Skin rash, itching	Non-serious	Expected	Known type of reaction; no hospitalization or life-threatening outcome reported.
02	Ibuprofen	Gastrointestinal bleeding requiring hospitalization	Serious	Expected	Hospitalization makes the event serious. GI bleeding is a recognized adverse effect.
03	Metformin	Lactic acidosis	Serious	Unexpected	Potentially life-threatening metabolic reaction; classified serious. Treated as unexpected for this case.
04	Atorvastatin	Elevated liver enzymes (mild)	Non-serious	Expected	Mild laboratory abnormality without reported serious clinical consequences.
05	Levofloxacin	Tendon rupture	Serious	Unexpected	Serious musculoskeletal event with significant clinical impact; classified unexpected for this case.

3. DEFINITIONS USED

Serious ADR	An adverse event meeting seriousness criteria such as death, life-threatening condition, hospitalization/prolongation of hospitalization, significant disability, congenital anomaly, or another medically important condition.
Non-serious ADR	An adverse event that does not meet the regulatory seriousness criteria.
Expected ADR	A reaction consistent with the known safety information for the medicine.
Unexpected ADR	A reaction whose nature, severity, or specificity is not consistent with the available reference safety information for the case.

4. SUMMARY

Serious cases	3	Cases 02, 03, 05
Non-serious cases	2	Cases 01, 04
Expected cases	3	Cases 01, 02, 04
Unexpected cases	2	Cases 03, 05

5. OVERALL ANALYSIS

Among the five cases, **three are classified as serious** and **two as non-serious**. Seriousness is driven by the clinical impact of the event, particularly hospitalization or potentially severe outcomes. For expectedness, **three cases are expected** and **two are unexpected** according to the classifications provided in the task case study.

6. FINAL CLASSIFICATION

Case 01: Non-serious, Expected

Case 02: Serious, Expected

Case 03: Serious, Unexpected

Case 04: Non-serious, Expected

Case 05: Serious, Unexpected

Note: This is a simulated pharmacovigilance training document based on the five cases and classifications shown in the Task 4 instructions. It is not a real patient safety report.
